

Figure 4 - α_t verifier-grounding signal
Lower α_t on SOTA model is expected: harder to distinguish from temperature

Round-12 (Zenil derivation): any inf_t $\alpha_t > 0$ preserves self-distillation convergence to the truth distribution μ_P . Both bars satisfy this; SOTA size of α_t reflects the smaller residual gap between Q_t and μ_P at large model scale.

-- Zenil bound: $\alpha_t > 0$
